

Automatic selector unit with pressure Sensor 0-420 bar

Art.Nr.: 82117

Automatic selector unit with pressure Sensor 0-420 bar for quick automatic filling from an intermediate buffer.

The selector unit allows fast automatic filling of one or more compressed-gas cylinders on filling panels or safety filling ramps from a buffer and simultaneously from the compressor. Priority has always one cylinder, which means the buffer and the compressor always fills the BA-or dive cylinder first. After the cylinder is filled, the buffer will be filled automatically until a new empty BA- or dive cylinder is connected to the system.
