Dive Control Container

Art.Nr.: HA200025

Dive Control Container.

For offshore and other applications we design and manufacture Dive Control Containers.

On the basis of 10 ft. or 20 ft. container steel construction works will be carried out in accordance to CSC regulations and designed and constructed for dive operations under current rules.

Breathing gas supply systems (HP compressors, storage cylinders, diver control panels) provide the required air volume; latest communication, video, recording and data storage technologies ensure monitoring and documentation of the dive operations and the dive sites.

Usually the containers are divided into two sections, the dive control room and the workshop space. The installed components in the workshop area provide everything needed for the production and storage of the breathing gas. The air supply and monitoring of the divers will be managed from the dive control room. This one includes the diver control panel, communication and video control.

For the production of Nitrox 21 – 40 % we can offer customized solutions as well.

Specification

Volume: cc 0
