Domeyer filling panels for breathing air compressors

Art.Nr.: HA100023

Domeyer filling panels are available as an optional extra for all breathing air compressors. According to requirements, they can be equipped with filling valves for

-hose connection
-direct bottle connection for
-one pressure range, PN200 bar or PN300 bar or PN420 bar or
-two pressure ranges.

The number of filling valves depends on the compressor delivery, which determines the filling time of the bottles. The second pressure range can be permanently available by means of a pressure reducer.

On filling panels with a pressure reducer, bottles can be filled simultaneously at different pressures.

All filling panels can be optionally equipped with an external compressor control unit. The control panel is built into the filling panel. Filling panels equipped with the external B-CONTROL control panel can only be used with compressor untis which are equipped with a B-CONTROL compressor control.

Furthermore, a memory control for the optionally recommended high-pressure memory can be integrated.
