B-Kool

Art.Nr.: HA100024

B-KOOL

-Rapid amortisation of procurement costs for the refrigeration dryer: Due to multiplication of the filter cartridge service lifetimes

-Huge potential for savings: Thanks to reduction in consumption of original filter cartridges

-Three different versions: for the new MINI-VERTICUS and VERTICUS, PE-VE Silent and BAUER compressors in open design.

In environments in which ambient temperatures are high in particular, the B-KOOL refrigeration dryer extends filter capacity almost beyond belief.

Operators benefit from much lower filter cartridge usage and storage costs in addition to longer interruption-free operation.
A clever approach to cutting costs and protecting the environment.

The normal service life (capacity) of a filter cartridge can be extended many times over by additional cooling of the compressed air with the B-KOOL refrigeration dryer. As a result of air cooling, most of the condensate is separated in the oil and water separator, so that the filter cartridge absorbs much less water vapour.

The cost of purchasing the B-KOOL refrigeration dryer pays itself off within a short time, as the B-KOOK massively reduces consumption rates for original filter cartridges. As a result, running costs are virtually

negligible.

Operation becomes even more cost-effective when the B-KOOL is used in conjunction with the B-SECURUS filter monitoring unit or B-DETECTION gas measurement system; the unit maximises filter cartridge life by optimising moisture content.
